

Category Fields

For Prestashop

Installation

Upload the contents of the module zip to the modules folder of your store via FTP. After upload, install the module from the Modules List Under Modules > Modules in the Prestashop Back Office.

Usage and Setup

Once installed, head over to the module configuration via the configuration link in the module list or the new link which now appears under the "Catalogue" menu in the back office. The configuration pages allows you to manage your category extra fields and enter content for them for each your store categories.

Before you can start adding content for your category fields you must set up some fields, to do this, click the "manage extra fields" button on the main module configuration page and your new field, for example "Information".

Once added, select a category to edit from the module configuration page. You should be presented with a list of fields to enter content for. The excerpt field is useful if you wish to display your field on your category page as collapsed by default, filling in excerpt field will make sure the module displays that content in the collapsed state, and the full content when expanded. You can choose which field displays as collapsed by ticking the collapsed option.

Once you're done editing the content for your category fields, save the content.

Front End – Important

Before the new fields will display on the front end you must add the following short code for each field you wish to display on your category page. Add this anywhere in your themes category.tpl file:

```
{hook h="categoryField" name="fieldname"}
```

Replacing fieldname with the name of the field you wish to display.

Support

If you require any help setting up the fields or run into issues or bugs please feel free to email me at musaffar.patel@gmail.com
